

**AERONAUTICAL CHARTING FORUM**  
**Instrument Procedures Group**  
**Meeting 14-02 – October 28, 2014**

**RECOMMENDATION DOCUMENT**

**FAA Control # 14-02-318**

**Subject:** Charting LNAV Engagement Altitudes

**Background/Discussion:** As NEXTGEN progresses at an increased pace with the Optimization of Airspace and Procedures in the Metroplex (OAPM) implementations across the country, industry is seeing an unprecedented increase in the use of RNAV SIDs at busy airports. Additionally, ATC has begun using the new “Climb Via” clearance phraseology on these SIDs. This combination has highlighted a whole new set of issues for aircrews and ATC alike, in particular, charting issues that cause confusion in the cockpit. Recent discussions have spotlighted an inconsistency in the charting of LNAV Engagement Altitudes on SIDs. Issues in particular include:

1. Discrepancy of when LNAV engagement altitudes are presented on the plan view of both AeroNav Products and Jeppesen charts.
2. Inconsistency of how the chart planview designates a crossing altitude between charts at different airports of same manufacturer (i.e. AeroNav Products)
3. Inconsistency of how the chart planview designates an engagement altitude between manufacturers (AeroNav versus Jepp).

Examples will be provided as it is the best way to see the breadth of the problem, but in general some SIDs have them and some do not. In most cases they only contribute to chart clutter and no useful purpose (see attached charts). Additionally, they may be charted as “usable altitudes” such as “1800” or may show up as “less usable altitudes” such as “1861”. It is possible that they are charted as “at”, “at or below”, or “at or above”, but really serve no purpose other than to anchor the RNAV leg type. Also, Jepp has added a “climb to” on the planview (consistent with AeroNav products text) that may be confusing pilots that think it is an altitude restriction.

These inconsistencies have been showing up as ASRS/ASAP reports, complaints, and pilot deviations. Of the most recent errors, crews were leveling at the LNAV engagement altitude on new KOKC SIDs that are 500 ft. above the ground (a contributing factor could be that “Climb Via SID” clearance was issued instead of “Climb and Maintain”- the SID has no published constraints other than the LNAV engagement altitude.). Additionally, it has been shown that pilot knowledge of “LNAV engagement altitudes” is very low. In many cases, the designation is just ignored, producing an industry wide illusion of understanding. In fact, there appears to be very little published on the topic and the name alone is a misconception since a true “LNAV engagement altitude” varies by aircraft type and is designated by the manufacturer and certified by flight standards processes. There are also discussions occurring as to whether or not these LNAV engagement altitudes are “altitude constraints” at all and how they should be treated by ATC.

Some attached example procedures are:

KBNA(DANLS2), KLAX (HOLTZ9), KLGA (JUTES2), and KOKC(MUDDE1)

Additional examples can be found at:

KCLT (all SIDs), KDFW (AKUNA5), KIAH (MMUGS1), KBWI (TERPZ3),  
KABQ(ADYOS2), and KLAS(COWBY5)

**Recommendations:**

Brief research of Order 8260.46, Departure Procedure Program, and Order 8260.58, US Standard for PBN Instrument Procedure Design, has not shown much insight regarding the requirements of the altitude. The only reference discovered is a requirement that "LNAV engagement Altitude be at least 500 ft. above the ground."

1. FAA clearly define criteria requirements for the LNAV engagement altitude (or its appropriate designation).
2. Determine the need for charting and standards necessary that will prevent confusing interpretations.
3. The AIM, PCG and Instrument Procedures Handbook should be updated to incorporate the appropriate guidance necessary related to the LNAV engagement altitude.

### PROCEDURE TEXT

This SID requires takeoff minimums  
(for standard minimums, refer to airport chart):  
**UNIV OF OKLA WESTHEIMER:**

Rwys 3, 17, 21, 35: Standard (or lower than  
standard, if authorized) with minimum climb of  
500' per NM to 1700'.

**WILEY POST:** Rwys 13, 17L/R, 31, 35L/R:  
Standard (or lower than standard, if authorized)  
with minimum climb of 500' per NM to 2100'.

**WILL ROGERS WORLD:**

Rwy 13, 17L/R, 18, 31, 35L/R, 36: Standard (or  
lower than standard, if authorized) with  
minimum climb of 500' per NM to 1800'.

Gnd speed-KT	75	100	150	200	250	300
500' per NM	625	833	1250	1667	2083	2500

**OBSTACLE**  
For TAKEOFF OBSTACLE NOTES  
see 10-3OB1.

AIRPORT	INITIAL CLIMB
UNIV OF OKLA WESTHEIMER	Rwy 3: Climb on heading 031° to 1700', then LEFT turn heading 355° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwy 17: Climb on heading 175° to 1700', then heading 175° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwy 21: Climb on heading 211° to 1700', then LEFT turn heading 175° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwy 35: Climb on heading 355° to 1700', then heading 355° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
WILEY POST	Rwy 13: Climb heading 130° to 1800', then RIGHT turn heading 200° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwys 17L/R: Climb on heading 175° to 1800', then RIGHT turn heading 200° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwy 31: Climb on heading 310° to 1800', then RIGHT turn heading 335° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwys 35L/R: Climb on heading 355° to 1800', then LEFT turn heading 335° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	ROUTING

From GLOPS on track 168° to MUDDE. Then on transition. MAINTAIN 3000' or as assigned by ATC. EXPECT filed altitude 10 minutes after departure.

AIRPORT	INITIAL CLIMB
WILL ROGERS WORLD	Rwy 13: Climb heading 130° to 1800', then RIGHT turn heading 175° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.
	Rwys 17L/R, 18: Climb heading 175° to 1800', then heading 175° or as assigned by ATC. EXPECT RADAR vectors to GLOPS.

Attachment 8 (continued)

**Initial Discussion – MEETING 14-02:** New issue presented by Lev Prichard, Allied Pilots Association. (L) Lev briefed the issue and talked about the Pilot Controller Procedure and Systems Integration (PCPSI) work group discussions on “Climb Via” vs. “climb and maintain” procedure differences. Discussions within the PCPSI led to the question of what are “LNAV engagement altitudes” and is this a procedure attribute that should be identified and called out to users on a chart? A lengthy group discussion followed (referencing examples on the presented the slides). Lev wrapped up the discussion with recommendations to define LNAV engagement altitude and to ascertain whether there is a need to identify it on procedures, explain it in published guidance, etc. Tom Schneider, AFS-420, advised there was never any intent to chart an “LNAV engagement altitude”. We have VA-DF (Heading to an Altitude [VA] until Direct to Fix [DF]) altitudes to support various needs, such as diverging courses for simultaneous departure procedures. These charted altitudes are not specifically for LNAV engagement. There is a requirement that LNAV be engaged no later than 500 feet above the airport elevation, prior to the aircraft executing a turn (i.e., altitude to climb to before next leg type navigation). A discussion followed regarding how this came to be interpreted as a constraining altitude and if it needs to appear on a chart or in the FMS. Tom asked the group where the ACF should go with the issue. Rick Dunham, AFS-420, briefed that they are reviewing FAA Order 8260.53, *Standard Instrument Departures That Use Radar Vectors to Join RNAV Routes*, criteria as it is absorbed by FAA 8260.58 and that AFS-420 would take a look at the guidance. Brad Rush, AJV-344, advised that by current criteria standards, all altitudes are “at-or-above” unless specifically stated otherwise, so that a pilot should never be leveling out on what is published as an at-or-above altitude on a Departure. Gary McMullen, Southwest Airlines, said in the short term, we should focus on VA/DF legs and publish all these altitudes as “at-or-above”. The group discussed a host of human factor issues, including historical issues and pilot techniques. Tom discussed looking at policy guidance regarding departure instructions text to help procedure designers publish these in a more clearly understood fashion.

**Status:** AFS-420 will review FAA Order 8260.53 & FAA Order 8260.46 and other criteria. **Item Open:** AFS-420

---

**MEETING 15-01:** Tom Schneider, AFS-420, briefed (L) on the last ACF discussion to remove the term “LNAV engagement altitude”, by revising the Order 8260.46 language for a climbing altitude to support a turn without referring to it as an “LNAV engagement altitude.” LNAV engagement is also referred to in Order 8260.53, which is being absorbed into Order 8260.58A, and steps are being taken to remove the term during the transfer. This term is not in the AIM/IPH. Lev Prichard, Allied Pilots Association, asked what this altitude is being called now and why. Tom said this is for the procedure developer, not the pilot, and we are saying there may be an altitude you need to reach before initiating the turn (a VA-DF scenario). It is then an at-or-above crossing altitude required before commencing a turn. Lev pointed out this would be a climbing constraint, and it is convoluted since it is driving whether “Climb Via” vs. “climb and maintain” situation exists. His conclusion is that it’s become a “climb via” scenario. Group discussion followed on existing procedures and different flight director systems. Three examples of ways to handle these: San Antonio (KSAT) – fly heading assigned by ATC; Nashville (KBNA) – fly heading xxx; Houston (KIAH) – heading to altitude to heading. He believes the KSAT example works the best. The question was asked how you reach a standard solution. Tom said there are design constraints for text to be used for charting.

Tom advised that Order 8260.46 terminology for initial climb instructions is used when required departure instructions must specify the actual heading to be flown after takeoff. Any existing procedures with “fly runway heading” will eventually be changed. Rick Dunham, AFS-420, advised the RNAV language currently in the Order 8260.53, will go away when absorbed into Order 8260.58A, and he wants to ensure this is being looked at. Tom will look at the language used for KSAT for possible incorporation into Order 8260.46F. Lev restated his desire to make the departures look the same (standardize) as much as possible. Gary Fiske, AJV-82, stated his desire to maintain ATC flexibility. Tom said original policy with for “Radar Vectors To Join RNAV Routes” departures was no coding until you reached the IDF (it was intended for ATC to allow for whatever ATC wanted until that point), which has now changed.

**Status:** AFS-420 will look at KSAT language to consider additions to Order 8260.46F.  
**Item Open:** AFS-420

---

**MEETING 15-02:** Tom Schneider, AFS-420, briefed that all references to “LNAV engagement altitude” in FAA Order 8260.46F have been deleted (was charted for VA-DF routing) and also they are being deleted during the transfer of FAA Order 8260.53 (Radar Vectors to RNAV) to FAA Order 8260.58A. Lev Prichard, APA, asked if those changes affect TERPs required altitudes (i.e., turning restriction vs. engagement altitude), which prompted a lengthy group discussion including: chart clutter; hybrid procedures; placing fixes to require navigation to those points; the AFS-420 IOU to look at San Antonio (SAT) procedure and associated language in FAA Order 8260.46F. Tom summarized that there are a variety of options in FAA Order 8260.46F for the procedure developer and the ATC facility to use when developing what is needed. This has been coordinated, commented on, and is currently up for AFS-1 signature (Note: Expect release within the next 30-45 days). Ted Thompson, Jeppesen, suggested closing this ACF item and Jeppesen will take an IOU to bring up any future issues that may arise with the FAA, or in another forum, if appropriate. There were no objections.

**Status:** Item Closed.
